

ChangePasswordPage Test Report

We are using Jest to test our code.

Test 1: Fill out the change password form and trigger the request

Objective: Verify that the password change form is filled correctly and triggers the update request, useForm.put with expected data.

Steps:

- Render the ChangePasswordPage.
- Fill the input fields
 - o Current Password: OldPassword123!
 - o New Password: NewPassword123!
 - o Confirm New Password NewPassword123!
- Click the register button.
- Verify the useForm.put is called with the correct payload.

```
Run | Debug
test('Fill out the register form and triggers register request', async () => {
  const mockPut = jest.fn();
  useForm.mockReturnValue({
    data: {
      currentPassword: 'OldPassword123!',
      newPassword: 'NewPassword123!',
      newPassword_confirmation: 'NewPassword123!',
    },
    setData: jest.fn(),
    put: mockPut,
    errors: {},
  });

  render(<<ChangePasswordPage/>);

  //Get inputs
  const currentPassInput = screen.getByLabelText(/current password/i);
  const newPassInput = screen.getByTestId('new-pass-input');
  const confirmPassInput = screen.getByLabelText(/confirm new password/i);
  const submitButton = screen.getByRole('button', {name: /register/i});

  //Fill out the form
  await userEvent.type(currentPassInput, 'OldPassword123');
  await userEvent.type(newPassInput, 'NewPassword123');
  await userEvent.type(confirmPassInput, 'NewPassword123');

  //Check input for correct values
  expect(currentPassInput).toHaveValue('OldPassword123!');
  expect(newPassInput).toHaveValue('NewPassword123!');
  expect(confirmPassInput).toHaveValue('NewPassword123!');

  //Simulate clicking register button
  await userEvent.click(submitButton);

  // Wait for the put function to be called with the correct data
  await waitFor(() => {
    expect(mockPut).toHaveBeenCalledWith('/password/change', {
      currentPassword: 'OldPassword123!',
      newPassword: 'NewPassword123!',
      newPassword_confirmation: 'NewPassword123!',
    });
  });
});
```

Findings:

- The form was correctly filled out.
- useForm.put was successfully triggered with the expected data and the request was posted to /password/change.

Test 2: Form cannot change password with empty fields

Objective: Ensure that the form does not submit when required fields are empty and that the correct validation errors are displayed.

Steps:

- Render the ChangePasswordPage.
- Get the inputs:
 - o Current Password
 - o New Password
 - o Confirm New Password
- Click the submit button with empty fields.
- Verify that all the fields are marked invalid.
- Ensure that useForm.put is not called.

```
test('Form cannot change password with empty fields', async () => {
  const mockPut = jest.fn();
  useForm.mockReturnValue({
    data: {
      currentPassword: '',
      newPassword: '',
      newPassword_confirmation: '',
    },
    setData: jest.fn(),
    put: mockPut,
    errors: {},
  });

  render(<ChangePasswordPage/>);

  //Get inputs
  const currentPassInput = screen.getByLabelText(/current password/i);
  const newPassInput = screen.getByTestId('new-pass-input');
  const confirmPassInput = screen.getByLabelText(/confirm new password/i);
  const submitButton = screen.getByRole('button', {name: /register/i});

  //Simulate clicking register button
  await userEvent.click(submitButton);

  //Wait for validation (HTML5 default browser validations)
  await waitFor(() => {
    expect(currentPassInput).toBeInvalid();
    expect(newPassInput).toBeInvalid();
    expect(confirmPassInput).toBeInvalid();
  });

  //Ensure the post function was not called since the form was not submitted
  await waitFor(() => expect(mockPut).not.toHaveBeenCalled());
});
```

Findings:

- The form correctly marked the empty fields as invalid.
- No submission occurred and useForm.put was not triggered.

```
PASS tests/ChangePasswordPage.test.js
ChangePasswordPage
  ✓ Fill out the register form and triggers register request (953 ms)
  ✓ Form cannot change password with empty fields (93 ms)
