Supervised by: Dr Kemi Ademoye

Project description

This project idea came from our shared interests in eating out which I can imagine you also enjoy & from this we created our own web application Restaurant Booking System for our restaurant, La Dolce Vita.

We built this from the ground up, using the latest frameworks with these being...

. Laravel, React & Inertia (middleware)

We have taken the time to learn these new to us frameworks with a vision in mind to create a refreshing website with an interface that our customers feel at home using while adding original features that we feel other restaurant's sites are missing. Users can make an account with us & use our custom authentication system for logging in.

We didn't stop at just a booking system, we also implemented a fantastic admin panel where menus can be updated, reviews can be altered or reviewed as well as an inventory management system.

Results

The end result of this project is to create a web application that users will enjoy & be impressed by, which when put together shows a full stack implementation of our interpretation of a sound website.

Users can register a new account & log in to see some useful information such as past & future reservations, this uses our custom-made authentication system which follows the necessary precautions such as password hashing. On request passwords can be updated as well as any other account information.

We've created an expansive database which allows us to make real time adjustments to the various menus as well as reviews on the website, this can be achieved by admins on their custom admin panel which is only accessible by authorized accounts. The database is also accountable for rendering the menu items & reviews while storing other critical information such as inventory levels & account information.
