

High Level Restaurant Websites:

Website 1 Wildwood - <https://wildwoodrestaurants.co.uk>:

Pros:

- . Home page has the current seasons menu linked, could be a potential feature for us
- . Navigation bar at the top of the page isn't centred but looks great being right aligned, unconventional style & something to think about
- . Restaurant finder page is easy to use, shows images of all restaurants as well as all info on them
- . Have their own food delivery website, much better user experience, something to consider
- . Food menus are pretty nice, when you click an item it brings up an image of it & nutritional value, something to consider

Cons:

- . No bottom footer, something we should implement for our website
- . Bottom footer is visible on every page but the home page, something to consider as it's down to preference
- . Pressed main menu a few times trying to go back to the homepage, it takes you to the food menu, got annoying over time
- . The only menu integrated into the website properly is the current seasonal menu, the group booking menu & lunch menu are PDF's, something not to do
- . On book a table page there is a static review, no name attached to it so could be a fake review, something not to do

Conclusion:

From my experience using this website I can tell this is a high-quality restaurant website, there are things to consider doing & not doing

The top 3 most important things we should do are make the food menus in a similar way that display the image as well as nutritional values as the food menus are top priority for us. Also, we should make sure that all menus are integrated into the website because it makes little sense to only make one menu & the others into PDF's. We should also have reviews on the web page but not make them static, leaves the validity of the reviews up for debate so get actual users reviews.

Website 2 Frankie & Bennies - <https://www.frankieandbennys.com>:

Pros;

- . The navigation bar looks good & is easy to use, also has background colour once you scroll past the video
- . Video plays as the background of the website, something to consider as this seems to be a recurring feature
- . Bottom footer looks good & all links work with clear names
- . The menus look good with high quality pictures & nutritional values for each item, can filter menus by item type so less info shoved in your face
- . Table booking service is fast & do not charge for a reservation, built for the site specifically, something to consider for our site

Cons:

- . Found it confusing at first to switch between the menus, the background around the dropdown for menus is the same colour as navigation bar as well as staying at the top of the page when you scroll past it, something to consider as this threw me off
- . When choosing a restaurant, the image displayed when choosing one is the same regardless of which one you choose, might be nice to add a picture of the actual location if we go down the choose restaurant route
- . No reviews or customer feedback present on the website, something to consider for our website as I think it's a beneficial feature

Conclusion:

After using this website, I deem it as a high-level restaurant website, there are a handful of features missing that I think it could benefit from but overall it is a sound experience & is bug free

The top 3 take aways from this website in my opinion are to put the change menu option somewhere that is easily accessible & familiar for users. This specifically confused me a handful of times & can be annoying after a while. Reviews & customer feedback should be implemented on the website somewhere with the most traffic, the home page for example. I see this as a good feature to have as it lets new & returning customers have reassurance that this is a good place to eat. Finally, we should consider making an in-house reservation system. This will allow us to make this feature work best for our website & restaurant's needs & will work best for users.
