

How to Use Laravel with React for Building Modern Web Applications

<https://www.bacancytechnology.com/blog/laravel-with-react>

Interesting Points:

- . “According to the [StackOver Flow Report 2024](#), React and Laravel are among the top frameworks and technologies”.
- . Must be an effective combination of technologies which will assist us in building an innovating project
- . “React js with Laravel also offers secure features, such as SQL injection prevention, CSRF safety, and authentication”
- . These are points of concern which if we deployed our project we would have to consider
- . Very nice feature that there’s already preventions in place to mitigate security breaches

Conclusion:

This article has been particularly good in explaining the benefits of using this combination of technologies, ranging from the security benefits to the productivity benefits. As you can create reusable components you can slot them together to make the same great web application with a fraction of the lines of code. I think the statistics on stack overflow also suggest these two are good choices only makes us more confident in our choice to use Laravel & React.
