

Low Level Restaurant Websites:

- . Just because I have deemed these websites as lower level does not mean we have nothing to learn from them, in most cases they are still good websites but just fall short when compared to companies with a higher budget and or understanding

Website 1 The Old Weavers - <https://www.weaversrestaurant.co.uk>:

Pros:

- . The home page when you first load onto the website looks professional, large high-resolution image
- . All pages work & have the information they should have on them
- . The social media links work
- . Has a working booking reservation system

Cons:

- . The menu is just a jpeg of the physical menu you get when you're at the restaurant
- . Bottom footer is mostly empty, info that is on there is wrapped tight to the right, something not to do as look bad
- . On the navigation bar it still has the Christmas menu & the Valentines menu when neither of these are currently needed
- . The image gallery page takes a long time to load all the images, something to consider if we use lots of images on our site
- . The about us page has a part where my guess is you can contact the restaurant from, guessing as it's not labelled so can only guess what it is, something to consider is labelling things & putting them in a relevant place

Conclusion:

Although this is a lovely place to eat at, I can confidently say this is a low-level restaurant website. There are quite a few things to consider doing to make sure our website doesn't have the same shortcomings but here are the 3 top features to consider implementing

First, we should ensure our website's navigation & information sits in the correct places. Example. The bottom footer here is basically empty & things that could be on it such as social media links & a contact us page are put into the website almost randomly. Secondly, we need to implement our menus properly. Don't think it's very professional just putting a JPEG on the website for every menu. Finally, we should have the logic in place to be able to remove menus or data that are not currently needed / out of season. Needs to be able to be done from the site.

Website 2 Refectory Kitchen - <https://www.refectorykitchen.com>:

Pros:

- . The overall website's styling looks good with a good ratio of quality images & text
- . The menus are simple & not throwing tons of info at you, something to consider as makes experience less daunting
- . Most pages are implemented nicely, especially our story page as it has some interactive components, something to consider doing ourselves
- . The social media links work, something for us to consider as this is a recurring feature

Cons:

- . The navigation bar on some of the pages is invisible due to the background images being similar colour to the navigation bars font, something to consider as this is a massive problem
- . Bottom footer is also basically invisible as the text colour clashes with the bottom footer image, again it is a massive problem
- . Once you leave the home page, I cannot find a way back onto it using DOM navigation the only way I can find to get back to home page is by pressing back button on browser, something to consider

Conclusion:

After using the website, I can say it is a low-level website, although the styling & overall site is great, the fundamental features & components are either not working or just not there. This is an example of focusing too much on presentation & forgetting completely about user experience, this is the biggest takeaway from this website as without functionality there's no point having presentation.

Another takeaway from this website which I think will benefit us is the way text for this restaurant is written, by this I mean we should make the text feel inviting. Doing this will benefit us as it will make potential first-time diners feel less anxious with eating here & overall will make the user experience better.
