1 Introduction

Now the project has come to an end and I have had a chance to reflect, as a whole I am pleased with how the project turned out and how the project progressed over this last academic year. My experience working on this project has been good for the most part, the tasks given to each member was completed by them (with a few exceptions) as well as members willing to take parts in various aspects of the project.

To briefly summarize, I believe that my contribution to this project was over what was expected of me. I was consistent with my contributions rather than working in smaller spurts of energy which allowed me to get tasks done at a pace that works for me and my other group members. Although I exceeded what was expected of me, like any person there were parts that I could have done better or been more involved in.

2 Project Participation

Throughout the development of the project, I made sure that I pushed myself to partake in near enough every part of the project. I am pleased with myself that I got stuck in and participated in many if not all aspects of the project.

In no particular order here are the parts of the project I participated in (there is a chance that I missed a few)...

I put myself in charge of creating the database script and maintaining it, this involved me creating the main chunk of the database with other members adding their own specific tables for their features. I made sure people would add their new tables and inserts into the script as I know that this is good practice in case of an unseen error.

I assisted LJ330 in creating the 'generic layout', I focused on creating the navigation bar which is seen on the generic menu as well as turning this layout into a react component. When we began making the layout we were still researching into the best practices for our project, and I found out that if you make it into a react component you can import it onto any page you want to use it which meant the code was only written once.

I created the logic for randomly displaying 3 random reviews from the database onto the home page.

I created all 3 menu pages, the only parts I didn't do for this feature were the add to cart and the nutritional info.

I created the search bar.

I created all 6 pages found from the account icon on the navigation bar, these pages being register, login, account information, change password, logout and create a review. I also created all the backend logic for these features.

I created some pages on the admin dashboard with these being the manage menu items and create menu items. I created everything associated with these pages including the backend and pages which you navigate to via these such as edit menu item.

I wrote the abstract.

I wrote the technical report.

I made sure to be available for other group members to assist in ways such as debugging or for general questions.

Again, I may be forgetting some things, but I basically made sure to cover all areas and help out as much as possible.

3 Critical Analysis

Although I feel like I was a strong group member throughout the duration of this project, there are parts where I feel that there is room for improvement. These ranging from availability, holiday downtime and feature implementation.

3.1 On Myself

To begin, here are my top 2 parts that I am happy with myself in doing...

Firstly, I am pleased with my git contributions throughout this project. I made sure to push to git incrementally and regularly as I know this is a good practice not just for me but for other group members, I also pulled from git before I began coding for the day and pulled from git when I finished coding for the day. This meant that I never had a problem of breaking the code base due to conflicts as I always was up to date.

Secondly, I am pleased with how I implemented my backend logic, specifically with my authentication and how images are loaded on the project and how users and admins can upload images to be used on the website. My authentication logic fully works with examples being password hashing and the use of cookies and tokens for logging and keeping a user logged in.

In contrast, there were parts which I did (or didn't do) which could have been better or of a higher standard, with my main 3 being...

I left a one or two of my features half-baked so to speak, for example the search bar on the navigation bar. The way I left this was that it trims all characters to lowercase and is injected as a url, for example it only really works with home and about as their routes are both lower case. I should have gone back and made it so like words go to their suggested web page but I was too focused on other parts.

Another limitation I brought upon myself was having too much down time in the winter break. I did not push any work in these 4 weeks (roughly) which I regret doing, I

done this as I didn't want to burn out and I knew that once term started again, I would go back to consistent work, although I stuck by my word it would have been better if I stayed consistent throughout the break also.

And for my last criticism, I wished I used the external pieces of software I setup, for example Trello workspace for the kanban board. I set this up so every group member could easily see what they needed to work on and what they have already done. I intended to make a new board for every sprint so members could see where every individual was at with their feature, but we never used it in the end. Also, the weekly minutes, nearing the end of the project we were all caught up with finishing features and I didn't make a note of every week, I regret doing this.

3.2 On The Group

Focusing on the group as a whole, we worked well and once we got going it was even better. Although I believe as a unit we worked particularly well I have some criticisms for a few of my group members, even though I believe they could of improved on these limiting factors as a whole everyone worked well and I am very pleased with each and every one of my members as a whole.

My main two criticisms are these...

Oj54 was supposed to implement the menu's as one of his features but never got round to doing it, this can be seen in the weekly minutes. I can commend him for doing the background research for implementing this but they never got round to doing it. In the long run this was not an issue as I decided to take this on as one of my features and I am pleased with how it came out; it would have been nice for oj54 to implement this and have more features under his name.

Secondly, there was inconsistent participation in our weekly meeting on Friday without our supervisor. Some people would stay home and ask if they could join via teams, which was difficult as it meant we would have to find a room where we could do this without interrupting other students. The reason this is important to me was because it allowed me to easily see what people were doing and either explain things or help members with issues. I understand that every person has different arrangements and issues and in the end it didn't impact that the project enough to call it a serious issue.

4 Conclusion

To conclude my thoughts and feelings on the project, I am overall pleased with my performance as well as the groups. If I had more time I would go back and improve on my unfinished features.

107 If I could go back and start this project all over again keeping the knowledge I have
108 learnt, I would make sure I used things such as Trello as I believe that would have helped
109 work flow.

110 One main takeaway from this project for me is that I have a better understanding on
111 that people work at very different paces, instead of rushing members, support them.

112 Now I have finished this project, my next step is to take everything I have learnt and
113 build a website for my brother-in-law who has just opened a tattoo shop. I believe I could
114 make a good website with everything I have learnt.
